

Qigong and Radiation Therapy in Coping with Cancer

Richard Changjin Chen, MS

Radiation therapy is a technique in healing cancer. It is the most advanced modern science when both Eastern and Western medicine don't work. However, it causes a lot of side effects for patients. It makes me consider that can I combine Chinese medical technology with American technology to develop a new way of treatment. In my 8 years study of Qigong (meditation, mind and body exercise), I believe that there is a new way in healing cancer which I will call Qigong Remedy: patients can overcome their illness through a course of Qigong-meditation exercise; also, Qigong doctor can project Qi radiation (energy flow) which was called Qigong Waiqi from the doctor's body to treat cancer, and this technique works. In September, 1995, there was a cardioarteriosclerosis patient from a martial arts club in Hyde Park, Chicago who was advised to have a heart transplant. When I heard this, I gave him a diagnosis. I found that the symptom center was in the cardiamuscle of the left ventricle and it was not necessary to transplant the heart. My friend gave me a ride to the hospital; I fixed the problem by sending out Qi (energy flow) from my hands to the patient's heart to make the blocked message pass through the heart. In just 30 minutes the patient felt his heart and chest were relieved. I gave him the healing up to two hours at that time. And he left the hospital on the second day. So that I think the combination of Eastern and Western healing science can help patient to obtain a comfortable treatment.

Both electromagnetic and nuclear radiation can cause mutations and cancer in a dose-related manner. Electromagnetic radiation includes ultraviolet (UV) radiation, X-rays, and gamma rays emitted from atomic nuclei. Nuclear radiation consists of charged particles such as alpha particles, beta particles, and protons, as well as uncharged particles such as neutrons. When sufficiently energetic electromagnetic rays or charged particles collide with atoms, they can ionize them to ions as free radicals. During the ionization of atoms by

electromagnetic rays, orbital electrons are ejected; if these secondary electrons have enough energy, they may then be capable of ionizing additional atoms (The course of Cancer 5).

Qi is the internal energy of life force. When Qi is projected out of a person's body, it is called Waiqi. Qi has been shown to be formed with low frequency fluctuation modulated infrared electromagnetic waves, the magnetic field, static, infrasonic waves, energetic particles, and other messages. It is a high energy manifestation of life force. It can pass through any barriers including nuclear (Innate Original Cosmic Qigong). Logically, this kind of message can destroy carcinoma. According to the abstract of the Study On The Effect Of Human Carcinoma Cells By Qigong Waiqi from Beijing China Immunology Research Center: A Qigong master used the technique of tissue culture, the method of cytogenetics and the electron microscope to study the Hela cells and SGC-7901 human gastric adenocarcinoma cells, the change of the cellular ultrastructure and abnormal structure of the chromosome of the cells. The results showed:

1. In 20 minutes, the average rate of killing the Hela cells by Qigong Waiqi was 30%. Through statistical analysis, the result had a static meaning (PO.01). And through the electron microscope, we found that degeneration of the cells took place, there was swelling, the endoplasmic reticula were dilated adversely, and the nuclei of cells were destroyed.
2. In 60 minutes, the average rate of killing gastric carcinoma cells by Qigong Waiqi was 25.02%. The results were stable and consistent, and the value of experiment was the difference between the experimental and control group (PO. 001). And scanning Electron Microscope (SEM) view showed that villi of the part of the gastric adenocarcinoma cells fell off. They were arranged indiscriminately, scattered. Some of them were in wiredrawing state. On the surface of some cells, not only the

microvillus fell off, but also there were some gaps and holes of varying size. A few cells were completely destroyed.

3. In 60 minutes, the effect on gastric adenocarcinoma cells chromosomes by Qigong Waiqi showed that the abnormal alteration of the chromosomes took place significantly after they received Qigong Waiqi. Among the changes were exchange, break, dicentromere and soon, and the ratio was remarkably increased (PO.01).

As the evidence above has shown, Qigong Waiqi was able to kill or inhibit the cells of human cervix carcinoma and gastric adenocarcinoma. This suggested that Qigong Waiqi could start a new way to cure carcinoma (Collection of Soaring Crane Qigong Articles 481).

The technique showed above is did by Qigong doctor. According to the report from the Department of Immunology General Hospital of Navy, China in 1987: Qigong master gave 202 cancer patients a course of healing, 2 hours per time and 15 to 20 times per course. The result of a course treatment was that 123 patients (60.89%) cancer condition changed better, 78 patients (38.61%) on change. 1 patient (0.50%) cancer condition changed badly.

Chinese people create a way to practice this Qi material which is called Qigong exercise (American term is meditation, Indian term is Yoga). People usually know that meditation is a kind of breath and mind exercise to relax from stress, and don't know it's medical value. However the Traditional Chinese Medicine comes from the study of Qigong-meditation. Through a period practice people can improve their body's ammunition function to cure disease and improve health. Qigong-meditation is a way to adjust the energy field of people's physical body. Through Qigong exercise, people can maintain a balance for the physical body. It is reported that the navy soldiers of Chinese nuclear submarine practice Soaring Crane Qigong to protect themselves from the injury of nuclear radiation. There is a Soldier called Hao, Gaoqing who got injury by nuclear radiation through his job, his

leukocytes was between 1700 - 3600 since 1981 to December 1987; After he practiced SCQ for one month in 1988, his leukocytes increased up to 6500 (Collection of SCQ Articles 416). This idea can be considered to find a good way in helping patients easily recover from the side injury of radiation Therapy.

As the international communication become popular, I think the combination of the Eastern and the Western medicine can help modern science to develop a good way in dealing with cancer and AIDS, if this idea is taken into consideration.
